

Northlake EEM Security Setup

PREPARED BY Energy Hippo implementation team

This document defines the fake EEM users for Northlake Stage 1 setup. It is not customer intake data. It is an EEM app setup target used to prove that a blank seed database can be configured through the product before task setup or fake data consumption begins.

The machine-readable version is [data/security/northlake-eem-security-v1.yaml](#).

Scope

Stage 1 covers the blank pre-go-live system:

- Created companies plus the built-in system company context.
- Groups.
- Users.
- Permission intent.
- Company-scoped access.
- Disabled-user and read-only-user regression cases.

Stage 1 does not cover bills, interval archives, gateway execution, workflow schedules, or task run history. Those belong to later stages.

Model

The intended shape is:

```
company -> group -> user
```

For implementation/support access, `CompanyID = -1` is the EEM system company. That context already exists and should not be created as a Northlake customer company.

Permissions are attached to groups through semantic permission profiles. The manifest intentionally does not use exact EEM permission IDs yet. When we drive the actual app, each semantic profile can be mapped to the concrete permission rows, screens, or roles that EEM exposes.

No user receives direct permissions in the manifest. That keeps security checks predictable: a user has access because they are in a group, and a group has access because it carries one or more permission profiles.

Company Contexts

Company/context	Type	Create in DBAdmin?	Why it exists
System (CompanyID = -1)	Built-in EEM system context	No	Owns DB/admin/setup, implementation, gateway-prep, and support read-only users.
Northlake University	Campus operations company	Yes	Owns the main campus setup, campus utility setup, broad reporting, and central finance roles. It does not duplicate Cedar Row hierarchy or meters.
Cedar Row Apartments	Operating company	Yes	Tests a smaller scoped company with its own admin, bill entry, bill import, reports, and audit access.
Northlake Thermal Plant	Internal service company	Yes	Tests internal service-provider behavior for chilled-water and steam allocations. It holds only the Central Plant, including its production meters and chiller controller points; served-building meters such as Library Steam belong to Northlake University.

Permission Profiles

The manifest defines these profiles:

Profile	Purpose
company_admin	Manage company settings, groups, users, and company-scoped security.
system_db_admin	Administer and verify the local/demo EEM database.
company_data_admin	Maintain company setup data without broad security administration.
hierarchy_setup	Configure sites, buildings, rollups, accounts, meters, and points.
utility_setup	Configure commodities, units, providers, utility accounts, and meters.
rates_admin	Configure tariffs, rate versions, charges, and allocation rates.
bill_entry	Manually create and edit unposted bills.
bill_import	Import bill files and review import batches.
report_viewer	View dashboards, reports, bills, hierarchy, and exports.
sustainability_reporter	View ENERGY STAR, emissions, solar, and renewable-attribute reporting.
audit_readonly	Read-only validation across setup, bills, reports, security, and audit history.
plant_operator	Maintain thermal plant meter metadata and view plant outputs.
thermal_allocation_admin	Manage internal chilled-water and steam allocation rules.
gateway_task_config_viewer	View task, gateway, workflow, and point setup without enabling or running anything.
implementation_admin	Partner setup role for app-driven validation in local/demo environments.
support_readonly	Partner support role for troubleshooting without changing data.

User Coverage

The first pass has 19 users:

User	Primary company	Coverage
Samantha Ireland	Northlake University	Customer executive admin and all-property reporting.
Jordan Hale	Northlake University	Facilities setup, utility setup, company admin, gateway/task config view.
Priya Nandakumar	Northlake University	Rates, utility setup, bill import, and thermal allocation finance.
Nora Chen	Northlake University	Shared bill import across Northlake and Cedar Row.
Iris Morales	Northlake University	Northlake manual bill entry.
Leo Martinez	Northlake University	Sustainability and cross-company reporting.
Emerson Fox	Northlake University	Campus data admin and hierarchy setup.
Maya Chen	Cedar Row Apartments	Cedar Row company admin, operations, and reports.
Marcus Reed	Cedar Row Apartments	Cedar Row manual bill entry.
Valerie Kim	Cedar Row Apartments	Housing operations and reports.
Devon Brooks	Northlake Thermal Plant	Thermal company admin, operator, and reports.
Riley Santos	Northlake Thermal Plant	Thermal plant operator and reports.
Keiko Tan	Northlake Thermal Plant	Thermal allocation and rate administration.
Quinn Roberts	Northlake University	Cross-company audit read-only.
Dana Okafor	Northlake University	Reports scoped to Science Center nodes only (intra-company node-scope case).
Avery Singh	System (CompanyID = -1)	DB admin and implementation admin.
Morgan Patel	System (CompanyID = -1)	Implementation admin and Stage 2 gateway/task prep view.
Taylor Bennett	System (CompanyID = -1)	Support read-only.
Casey Holt	Northlake University	Disabled former bill-entry user.

Validation Cases

This security model is useful because it exercises several permission shapes:

- A campus operations company with broad setup and reporting roles.
- A separate operating company with scoped bill and report roles, without duplicating its hierarchy or meters in the campus company.
- An internal service company with plant operations and allocation setup.
- Built-in system-company DB/admin/support access.
- Shared bill import across companies.
- Cross-company audit read-only access.

- Disabled-user membership that must not allow login.
- Stage 1 gateway/task visibility without task execution.

The expected counts are 3 created companies, 1 built-in system company context, 27 groups, 19 users, 18 active users, and 1 disabled user.
